# ASSET Electrical Method

## Introduction

James Lee  
Weight Engineering

# CDR Goals

---

- Present what is in the method
- Explain how the method works

Explain method design, screens, and data flow

- Obtain critique to improve method (Action Items)

# Principal Cross-Functional Contacts

---

|                  |   |

ASSET EPGDS

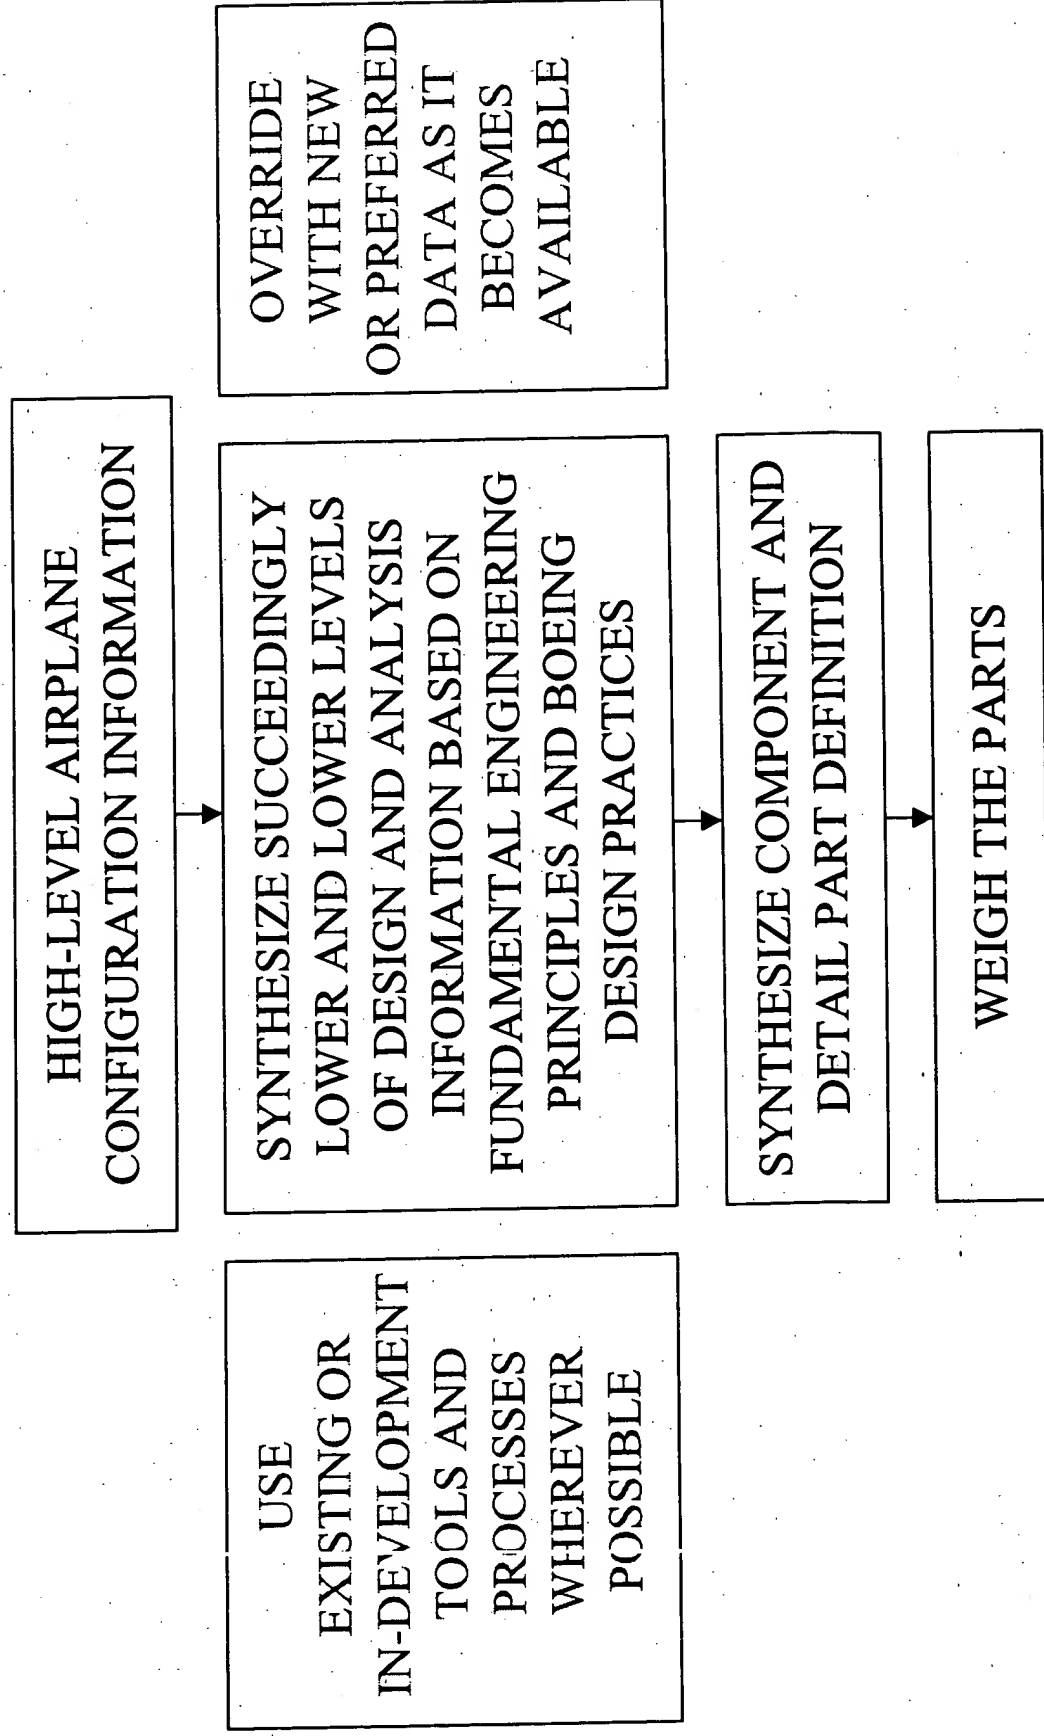

# WHAT IS ASSET?

ASSET IS A SET OF ENGINEERING TOOLS THAT SYNTHESIZE AN APPROXIMATE PART-LEVEL DESIGN DEFINITION FROM A COMBINATION OF:

- AIRPLANE LEVEL CONFIGURATION DATA
- FUNDAMENTAL ENGINEERING THEORY
- CROSS-FUNCTIONAL DESIGN/ANALYSIS PRACTICES
- MORE DETAILED DATA, AS IT BECOMES AVAILABLE

THE SYNTHESIZED DESIGN IS THEN ASSESSED FOR WEIGHT, COST, RELIABILITY, ETC.

# THE ASSET CONCEPT

# BENEFITS OF EARLY PRODUCT DEFINITION

# Technical Review

## Parametric vs. Design-Based Weight Analysis Tools

---

### Parametric (old method)

### Design-Based (new method)

### Disadvantages

- Design Definition Unknown
- Weight Control Impossible
- No Trade Capability

### Advantages

- Discriminates Between Designs
- Weight Control Possible
- Has Trade Capability

# Thrust Reverser

## Concept

- Strut Type
- Duct Type
- Load Share
- Bypass Ratio
- Accessories Location

## Conditions

- Design Conditions
- Thrust Levels
- Acoustic Requirements
- Air Flow Rates
- Pressures
- Temperatures
- Aero Characteristics
- Deployment Rates
- External Loads

## Configuration

- Lengths / Diameters
- Load Paths
- Bifurcation Angles
- Sleeve Stroke
- Duct Area
- Cascade Area
- Acoustic Lining

## Sub Assembly

- Envelopes
- Part Arrangements
- Cutouts
- Internal Loads
- Section Properties
- Component Quantities
- Fastening

## Part

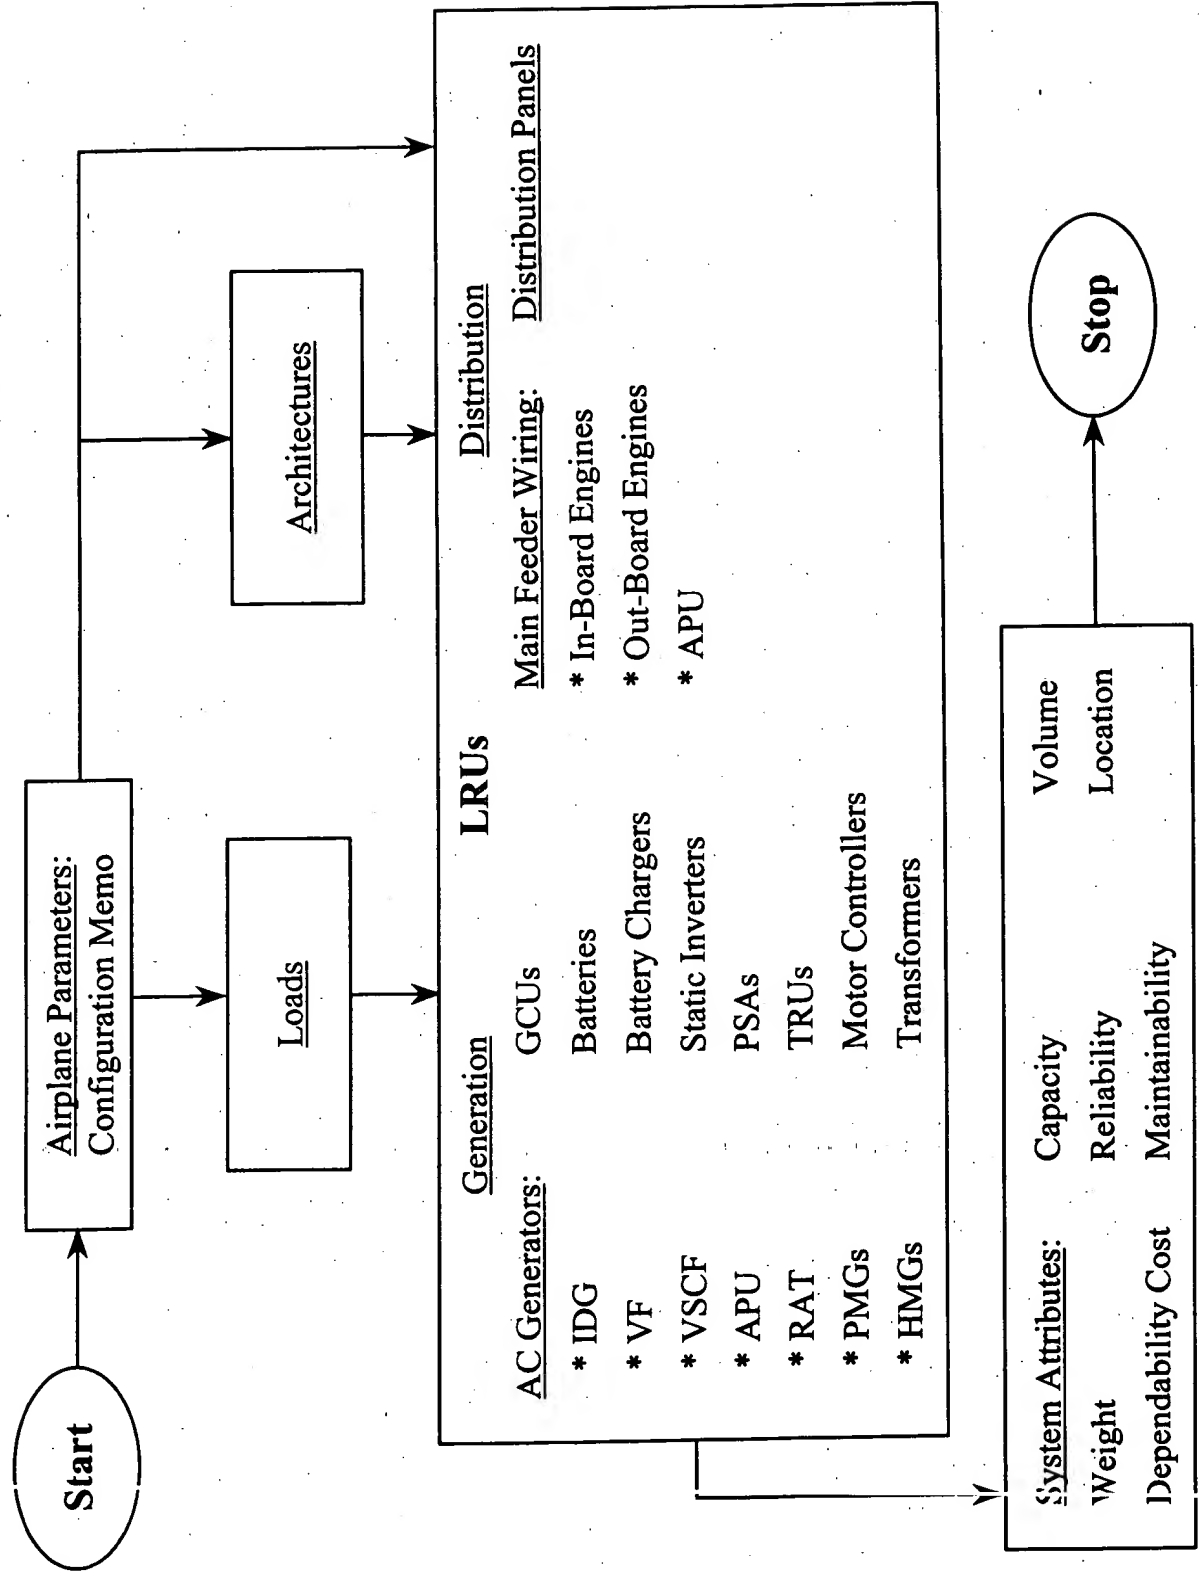

- Dimensions
- Stresses
- Material – Properties
- Manufacturing Methods
- Gages
- Weight

# Knowledge-Based Method Development Strategy

# ASSET Electrical Method System Architecture

George Gregorios  
Weight Engineering

# System Architecture - Purpose

- System Architecture along with Load Analysis , FAR and Boeing Requirements are the basis of sizing power sources.
- System Architecture will populate the system attribute table with electrical generation/conversion components to generate systems weight.

# Internally Generated System Architecture

For minimum ASSET requirements, the following Electrical Power System Architecture was considered baseline:

Twin Engine, Non Fly-By-Wire: 767-200/737NG, 2- Channel, Isolated

Twin Engine, Fly-By-Wire: 777-300, 2 - Channel, Isolated

Four Engine, Non Fly-By-Wire: 747-400, 4 - Channel, Split Parallel

Four Engine, Fly-By-Wire: Large Airplane PD, 4 - Channel, Isolated

- Users can override internally generated architecture

# System Architecture - Screen Pull-down Menu

Pull-down menu for Architectures:

# ASSET Electrical Method

## Load Analysis

George Gregorios  
Weight Engineering

## **Load Analysis - Purpose**

The load analysis is the basis for sizing the electrical power system during development.

It considers the maximum configuration and is used to validate the system capacity.

- With ASSET minimum input requirements, internally generated loads is needed for power source sizing to generate electrical system generation/distribution weights.

## **Methodology/Assumptions**

- Analysis for each power system configuration are sorted by ATA.

For minimum input ASSET requirement, internal generated loads are calculated using a selected baseline loads (narrow body= 737-800 HAP YC003, wide body= 777-300 CAT WA504) scaled up to a given configuration or system architecture data such as number of engines, number of passengers, range/mission, number of pumps and fans.

Steady state, worse case, end of life.

No in-rushes or momentary loads.

- Duty cycle/utilization factor applied to intermittent loads.

# **Methodology/Assumptions**

Main feeder losses, conversion efficiencies included.

Apply 15% error/growth factor to total calculated values for power source sizing.

Users can override internally generated loads.

# **Example of Methods - Internally Generated AC Loads**

## **ATA 21 Air Conditioning**

Algorithm:

Wide Body

Calculated Load= 777 ECS loads x (No. of Pass. / 777 No. of Pass)  
x (Number of Fans / 777 Number of Fans)

Narrow Body

Calculated Load= 737NG ECS loads x (No. of Pass. / 737NG No. of  
Pass) x (Number of Fans / 737NG Number of  
Fans)

ATA 21 Major Fan Loads: Re-circulating, E/E Cooling Vent and  
Supply, IFE/AVOD.

# Power Sources Sizing - Assumptions

FAR 25.1351 and the following Boeing requirements are used to determine the size of power sources.

- Generators sized to support all essential loads on one generator.
  - Dispatch with one generator inoperative.
  - APU generator operate on ground only.
- Dispatch with one TRU out

Static Inverter must be capable of powering all flight critical AC loads during emergency operation.

# Loads Analysis - Screen Down Menu

|                           | <b>TOTAL LOAD</b>       |     |                  |                                       |                   | 0               | 0                                   | 0                              | 0                   | 0                      | 0                 | 0                                   |

Notes:  
1.) Total kVA is simply a summation of the individual load kVA and is not calculated from the real KW & reactive KVAR values  
2.) Utilization/Demand Factor multiplied by Connected Load results in Average Load. Utilization/Demand Load represents percentage of time the system operates during a given mode of operation.  
3.) IFE/AVOD Cooling will be carried under IFE/AVOD Load Analysis section

Demand/Utilization Factor:  
For Air Conditioning System, Demand factor is 100%, since in general these loads operate continuously throughout all modes of operation.

Door Heaters, Galley Heaters and Capt/FO Aux Heaters are operational 100% in flight phase only.

Essential/Emergency Operation:  
Assume Recirculating, Lavatory, Galley Fans and all AC utility busses load are shed, E/E cooling fans remain on

- APU Start Rate
- RAT, HMG Availability Probabilities (if needed)

### **2 or 3 Fault Tree Outputs screens**

- Loss of All (Non-standby) AC Power
- Loss of All (Non-Flight Control) DC Power
- Loss of All FCDC Power (*for FBW configurations*)

# General Approach to Fault Tree

## **Depends on configuration:**

- 2 or 4 Engines
- FBW or Non-FBW

## **• Output probabilities:**

- Loss of All AC
- Loss of All non-FC DC
- Loss of All FC DC

## **Modeled as “Loss of All Sources”**

- (source includes anything equivalent, e.g. GCU, GCB, etc.)

# Why Only Consider Sources?

Allows simplicity of model at this stage

- Intuitively, safety event probabilities *shouldn't* be driven by smaller components
- In practice, safety event probabilities *aren't* driven by smaller components
    - (typically, 4 or more significant figures unaffected)
- Therefore, no need for added complexity

# Probabilities Required in Model

| Equipment with Failure Rates or<br>Availability Probabilities Needed | Quad<br>FBW | Quad<br>Non-<br>FBW | Twin<br>FBW | Twin<br>Non-<br>FBW |
|--|-------------|---------------------|-------------|---------------------|
| Main Gen, GCU, GCB, Engine,<br>Other Gen Channel                     | X           | X                   | X           | X                   |
| Aux Gen, APU   | X           | ?                   | X           | X                   |
| RAT, RAT GCU, PMG  | X           |                     | X           |                     |
| Main Gen Shaft   | X           |                     |             |                     |
| BUG, BUG Shaft   |             |                     | X           |                     |
| HMG, HMG GCU   |             |                     |             | ?                   |

ASSET EPCDS Method

# Loss of All Non-standby AC Power

Includes the following sources:

- All Main AC generators
- APU Generators (unless option declined in Quad Non-FBW configuration)
- Backup Generators (only in Twin FBW config.)
- Hydraulic Motor Generator (if option chosen in Twin Non-FBW configuration)

# Loss of All Non FC DC Power

Includes the following sources:

- All Main AC generators
- APU Generators (unless option declined in Quad Non-FBW configuration)
- Backup Generators (only in Twin FBW config.)
- Hydraulic Motor Generator (if option chosen in Twin Non-FBW configuration)
- RAT Generator (in FBW configurations)

# Loss of all FC DC Power

- Only used in FBW configurations

Includes the following sources:

- All Main AC generators
- APU Generators (unless option declined in Quad Non-FBW configuration)
- Backup Generators (only in Twin FBW config.)
- Hydraulic Motor Generator (if option chosen in Twin Non-FBW configuration)
- RAT Generator
- PMG's (on Main Gen. for Quad, on BUG for Twin)

# Relationship of channels (*visible in ASSET*) to basic events (*not visible*)

| Channel                    | Basic Events   |
|----------------------------|--|
| Main Generator             | Generator, Engine IFSD, GCU, GCB, “other channel faults” (e.g. feeder faults, CT faults, etc.) |
| APU Generator Backup Power | APU No-start, APU IFSD, APU GCU, APB, “other channel faults”                                   |
| HMG                        | Converter, Left AND Right (Backup Generator, Engine, HMG Unavailable, HMG IFSD, HMG GCU        |
| RAT                        | RAT Unavailable, RAT IFSD, RAT GCU   |
| PMG                        | PMG, Main or Backup Generator Shaft (as appropriate), Engine                                   |

# Example of Fault Trees:

## *Twin FBW (baseline 777)*

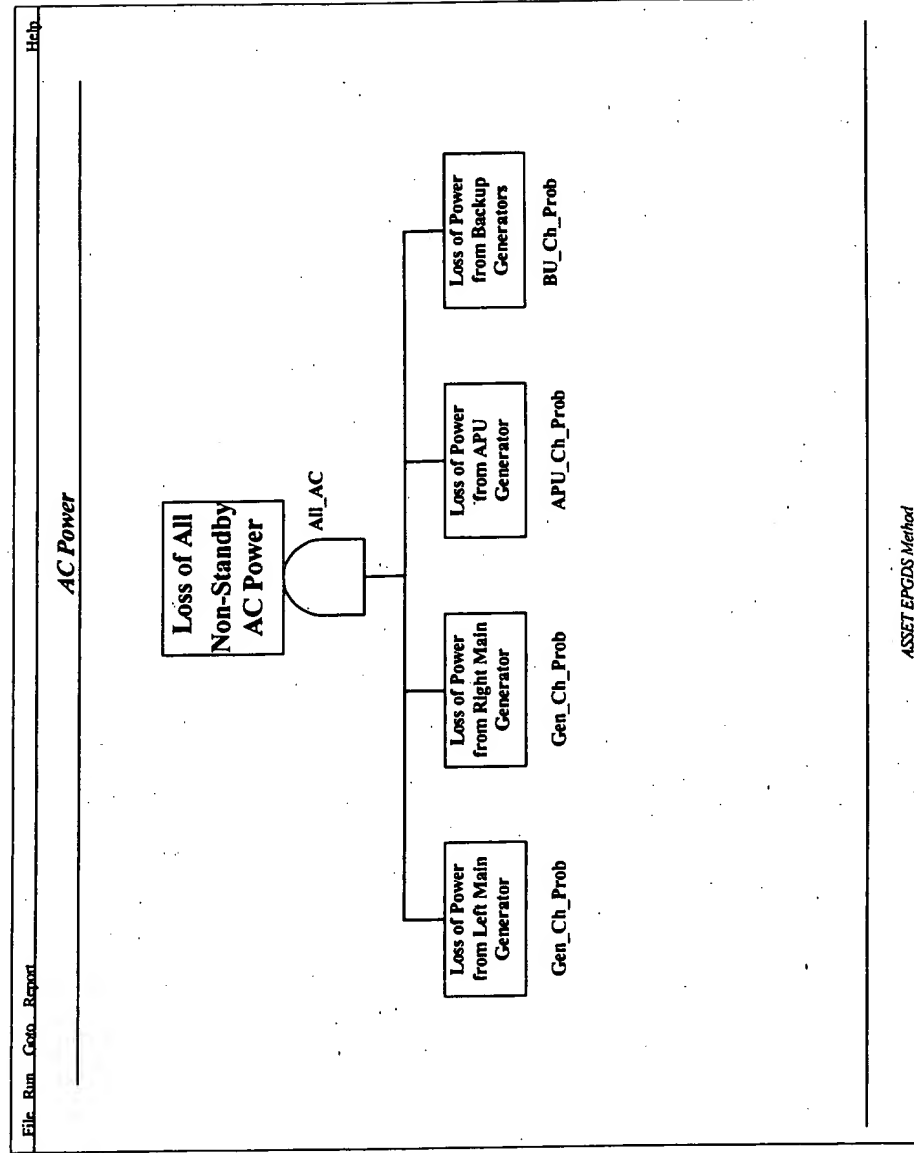

ASSET screens show only top level

IRAP calculates values based on input line items

Top event probability may not equal product of second-level probabilities due to multiply

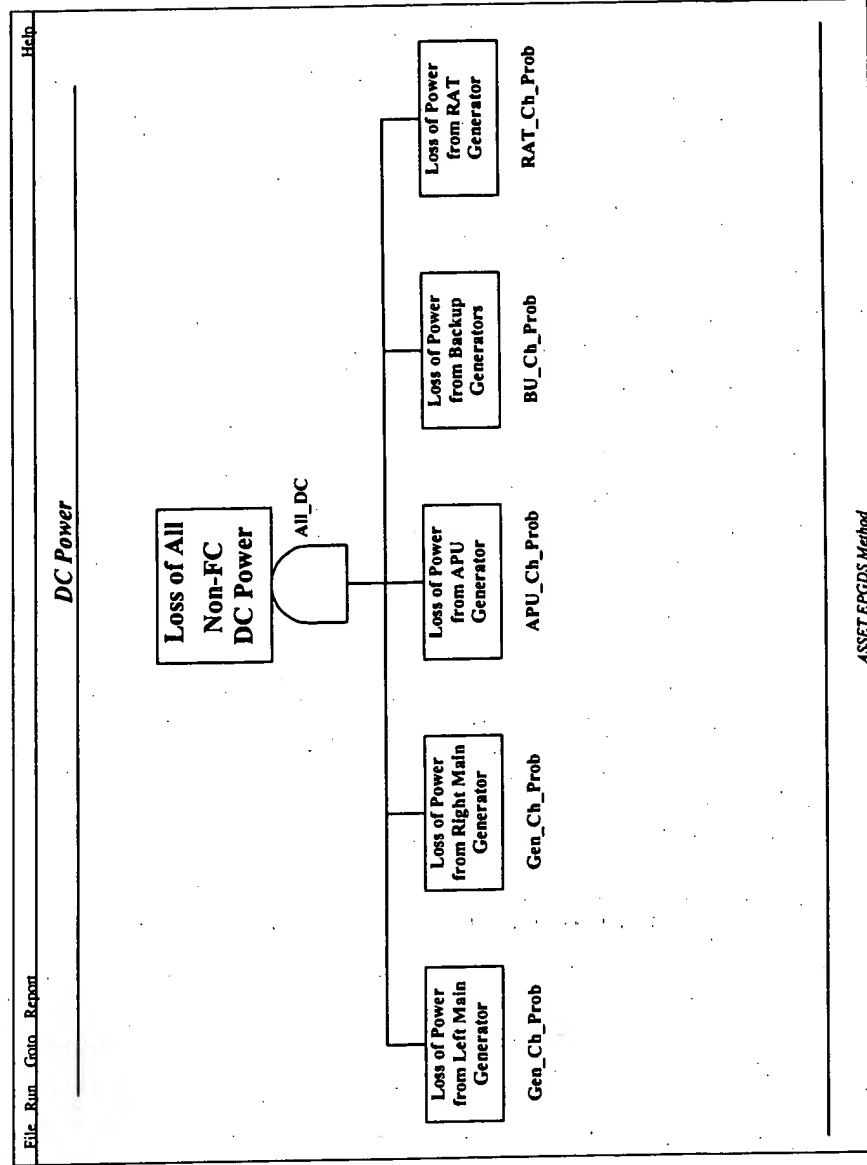

occurring events (*e.g. Engine IFSD affects both Main and Backup Generators*)

ASSET EPGDS

# ASSET Electrical Method Maintainability

Paul M. Covert

RM&T

# ASSET EPGDS

## Maintainability Module

- Calculates Inherent Availability (IA) for the Main Generator system

Contains three screens:

- Maintenance Corrective Times screen
- Maintenance Preparation Times screen
- Inherent Availability screen

# Maintenance Corrective Times

- Calculates Mean Corrective Time (MCT) for Unscheduled Removals, Servicing, and Alignment & Adjustment
- Includes several Maintenance Corrective Time inputs for each type of maintenance
- Sums those inputs to arrive at MCT for each type of maintenance

Also requires input of each maintenance frequency

# Maintenance Corrective Times Screen

| File Run Goto Report                               |  | Maintenance Corrective Times |  |  | Help |

ASSET EPGDS Method

# Inherent Availability

## Calculation

- The Mean Maintenance Preparation Time (MMPT) and Mean Time To Repair (MTTR) are weighted averages of the MPT and MCT for the three types of maintenance
- The Mean Maintenance Down Time (MMDT) is the sum of these
- The Mean Time Between Maintenance (MTBM) is found by combining the Unscheduled Removal, Servicing, and Alignment/Adjustment frequencies
- The Inherent Availability is calculated by the model as  $MTBM / (MTBM + MMDT)$

# Inherent Availability Screen

# ASSET Electrical Method Dependability Cost

Mahyar Rahbarrad

RM&T Airline Cost Analysis Group

# Method Process Flow Diagram

# Project Objective

Incorporate *Dependability Cost* Estimation Capability For IDG/VFG Into ASSET Electrical Power System Module.

**Dependability:** *A quantitative assessment of an airplane's ability to meet schedules, require low-cost maintenance, and be easily and quickly restored when a failure occurs.*

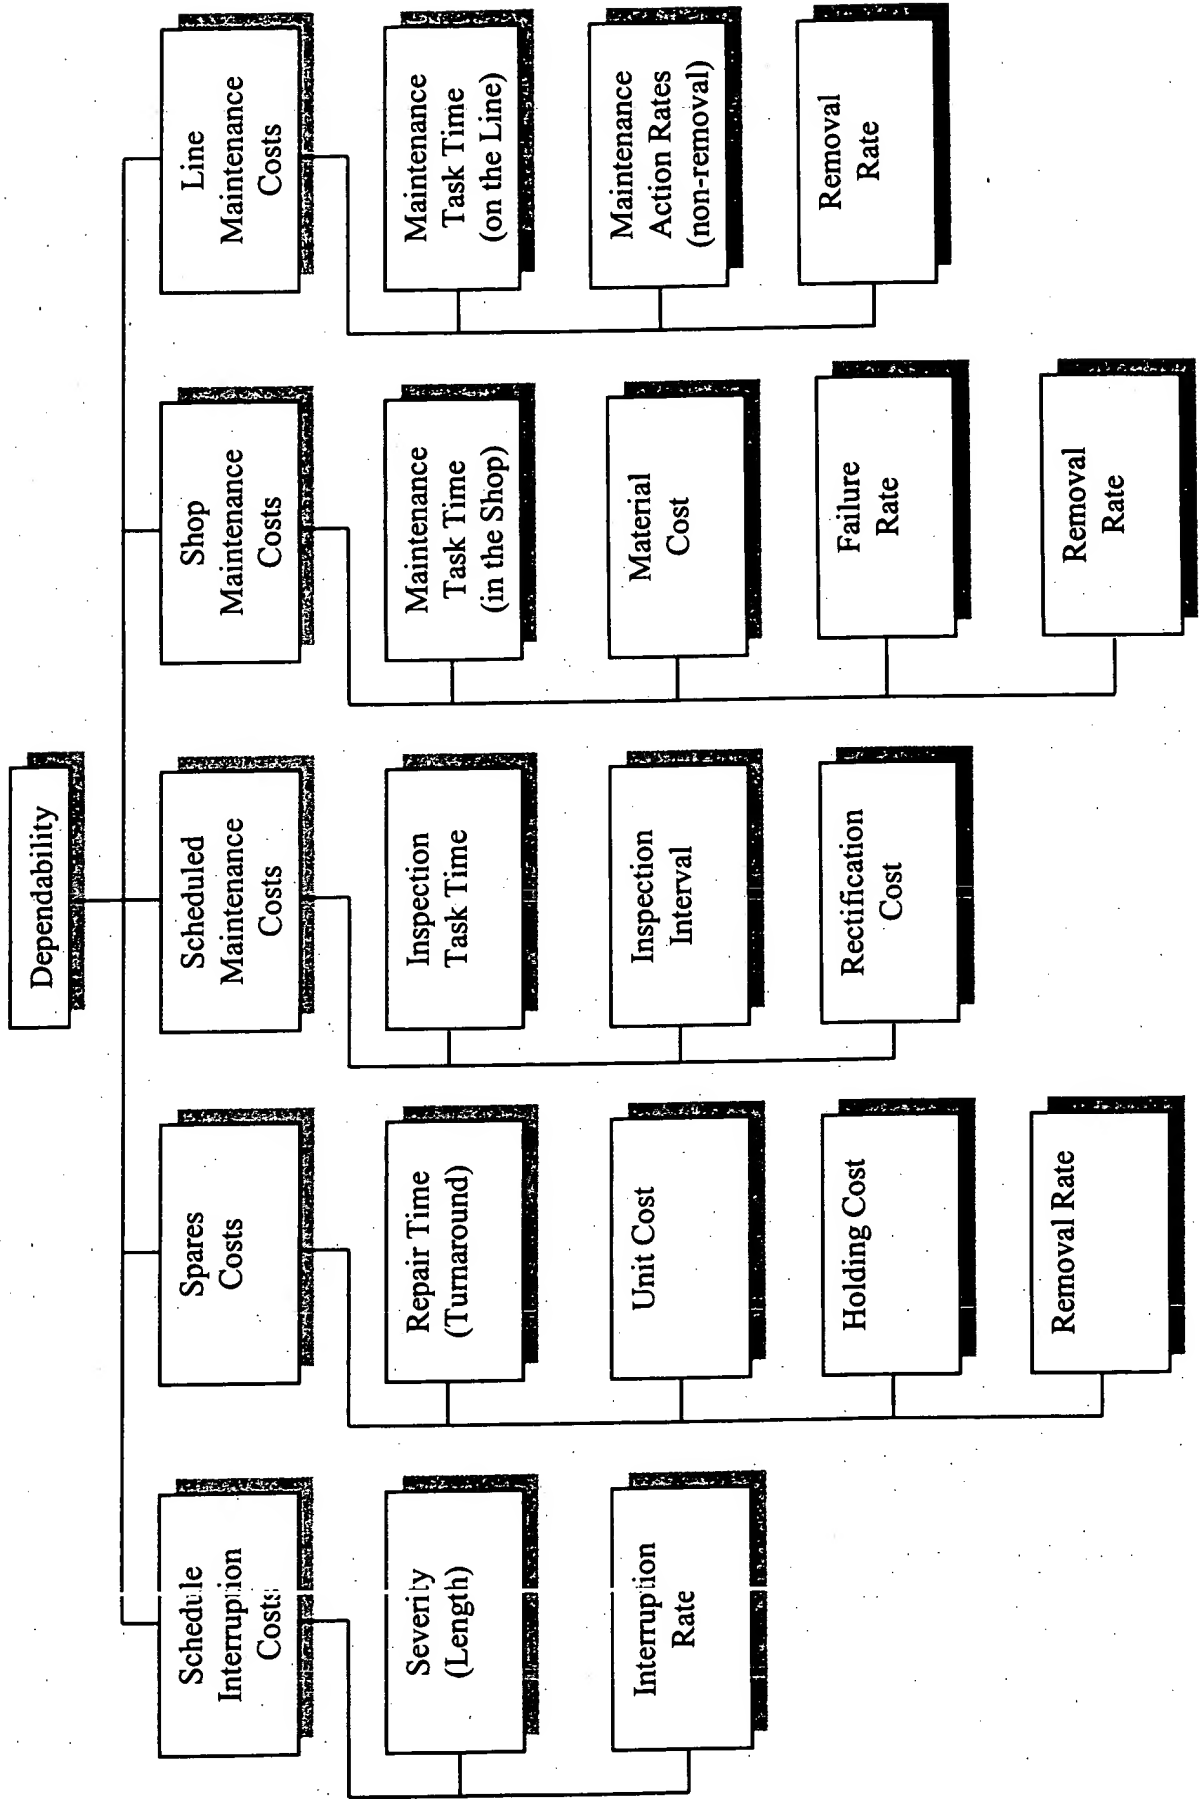

# 5 Elements of Dependability Cost

Bob Bond  
ASSET Method Development

# Report Implementation

Air Transport Association (ATA) Chapter 24  
is the baseline reporting method

Standard Weight Attributes (SWA's) will be  
added to SW Functional Spec by 12/23/99

- Function Code 32 will not be implemented

ASSET EPGDS

# ASSET Electrical Method Main Power Feeders

Bob Bond  
ASSET Method Development

# Cross-Functional Support

Key to method cycle-time reduction & acceptance as “best practice”

Simplified theory provided by Ed Woods

Ed presented the technical aspects to ET  
Management at Technical Thrust Review

# Objective

**Build generator feeder performance analysis method to:**

1. Provide simplified impedance calculation
  - Include non-linear frequency effects
  - Include effects of temperature
  - Include effects of altitude and feeder bundle physical arrangement
2. Calculate feeder weight and voltage drop
3. Select feeder type based on temperature

# Method Process

- Start with Boeing wire specs (BMS 13-60)
  - Weight - lbs/1000 ft
  - DC resistance - ohms/1000 ft
- Use results of magnetic field analysis to determine frequency effects on current distribution within conductor

# ASSET Electrical Power System

# 400 Hz Loss Distribution in Three-phase Bundle

# Curve Fits for Simplification

Curve fit data describing resistance and reactance (based on loss and energy from magnetic field analysis)

$$\bullet R = R_{dc} + a_0 \cdot \text{freq}^{a_1} \quad \text{ohms}/1000 \text{ ft}$$

$$\bullet L = 1/(c_0 \cdot \text{freq} + c_1) + c_2$$

$$\bullet X = 2 \cdot \pi \cdot \text{freq} \cdot L \quad \text{ohms}/1000 \text{ ft}$$
